Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Problem – Solution Fit:

The Problem–Solution Fit for the ServiceNow Import Data using Transform Maps project means identifying the problems users face when importing large amounts of spreadsheet data into ServiceNow and providing a solution that efficiently transfers, maps, validates, and manages the data. The solution uses Import Sets and Transform Maps to reduce manual data entry and improve the accuracy and consistency of records.

Purpose:

1. Solve data-import problems by providing a structured way to transfer spreadsheet data into the appropriate ServiceNow target table.
2. Reduce manual work and save time by importing multiple records from a spreadsheet instead of entering each record individually.
3. Improve data accuracy and consistency by using field mapping, transformation rules, validation, and Coalesce conditions.
4. Reduce duplicate and incorrect record by identifying existing records and controlling whether data should be inserted or updated.
5. Understand the existing data-import process and improve it through a systematic workflow consisting of spreadsheet preparation, Import Set creation, Transform Map configuration, field mapping, transformation, and target-record validation.
6. Increase user efficiency and satisfaction by providing a repeatable and manageable method for bulk data import into ServiceNow.

Import Data using Transform Maps— Spreadsheet

Purpose / Vision: Import spreadsheet data accurately into ServiceNow target tables
