

Project Design Phase

Date	01 October 2026
Team ID	SWTID-2026-9577
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Proposed Solution:

S.No	Parameter	Description
1	Problem Statement (Problem to be solved)	Manually entering large amounts of spreadsheet data into ServiceNow is time-consuming and can introduce duplicate, missing, or incorrectly mapped records. The project aims to import spreadsheet data into a ServiceNow target table accurately and efficiently.
2	Idea / Solution description	Use a ServiceNow Import Set and Transform Map to transfer spreadsheet data into the target Employee table. The workflow includes spreadsheet preparation, Import Set upload, Transform Map creation, source-to-target field mapping, optional Coalesce configuration, transformation, and validation.
3	Novelty / Uniqueness	Provides a structured and reusable bulk data-import workflow instead of repetitive manual record creation. Field mapping and Coalesce can be configured to control how spreadsheet values match existing target records.
4	Social Impact / Customer Satisfaction	Reduces repetitive administrative work, improves data consistency, and helps users complete bulk updates faster. Clear transformation and validation steps reduce common data-entry errors.
5	Business Model (Revenue Model)	Can be implemented as part of ServiceNow implementation and data-migration services. The same workflow can support employee onboarding, master-data migration, periodic spreadsheet updates, and other bulk data operations.
6	Scalability of the Solution	The workflow can be reused for different spreadsheets, source tables, and target tables by changing Import Set and Transform Map configurations. Additional mappings, validation rules, and Coalesce conditions can be added as data volume and requirements grow.
